### Description

The INA219 is a current shunt and power monitor with an I<sup>2</sup>C- or SMBUS-compatible interface. The device monitors both shunt voltage drop and bus supply voltage, with programmable conversion times and filtering. A programmable calibration value, combined with an internal multiplier, enables direct readouts of current in amperes. An additional multiplying register calculates power in watts. The I<sup>2</sup>C- or SMBUS-

### Features

- Senses Bus Voltages from 0 to 26 V
- Reports Current, Voltage, and Power
- 16 Programmable Addresses
- High Accuracy: 0.5% (Maximum) Over Temperature (INA219B)
- Filtering Options

## INA219 Zero-Drift, Bidirectional Current/Power Monitor With I<sup>2</sup>C Interface

### 1 Features

- Senses Bus Voltages from 0 to 26 V
- Reports Current, Voltage, and Power
- 16 Programmable Addresses
- High Accuracy: 0.5% (Maximum) Over Temperature (INA219B)
- Filtering Options
- Calibration Registers
- SOT23-8 and SOIC-8 Packages

### 2 Applications

- Servers
- Telecom Equipment
- Notebook Computers
- Power Management
- Battery Chargers
- Welding Equipment
- Power Supplies
- Test Equipment

### 3 Description

The INA219 is a current shunt and power monitor with an I<sup>2</sup>C- or SMBUS-compatible interface. The device monitors both shunt voltage drop and bus supply voltage, with programmable conversion times and filtering. A programmable calibration value, combined with an internal multiplier, enables direct readouts of current in amperes. An additional multiplying register calculates power in watts. The I<sup>2</sup>C- or SMBUS-compatible interface features 16 programmable addresses.

The INA219 is available in two grades: A and B. The B grade version has higher accuracy and higher precision specifications.

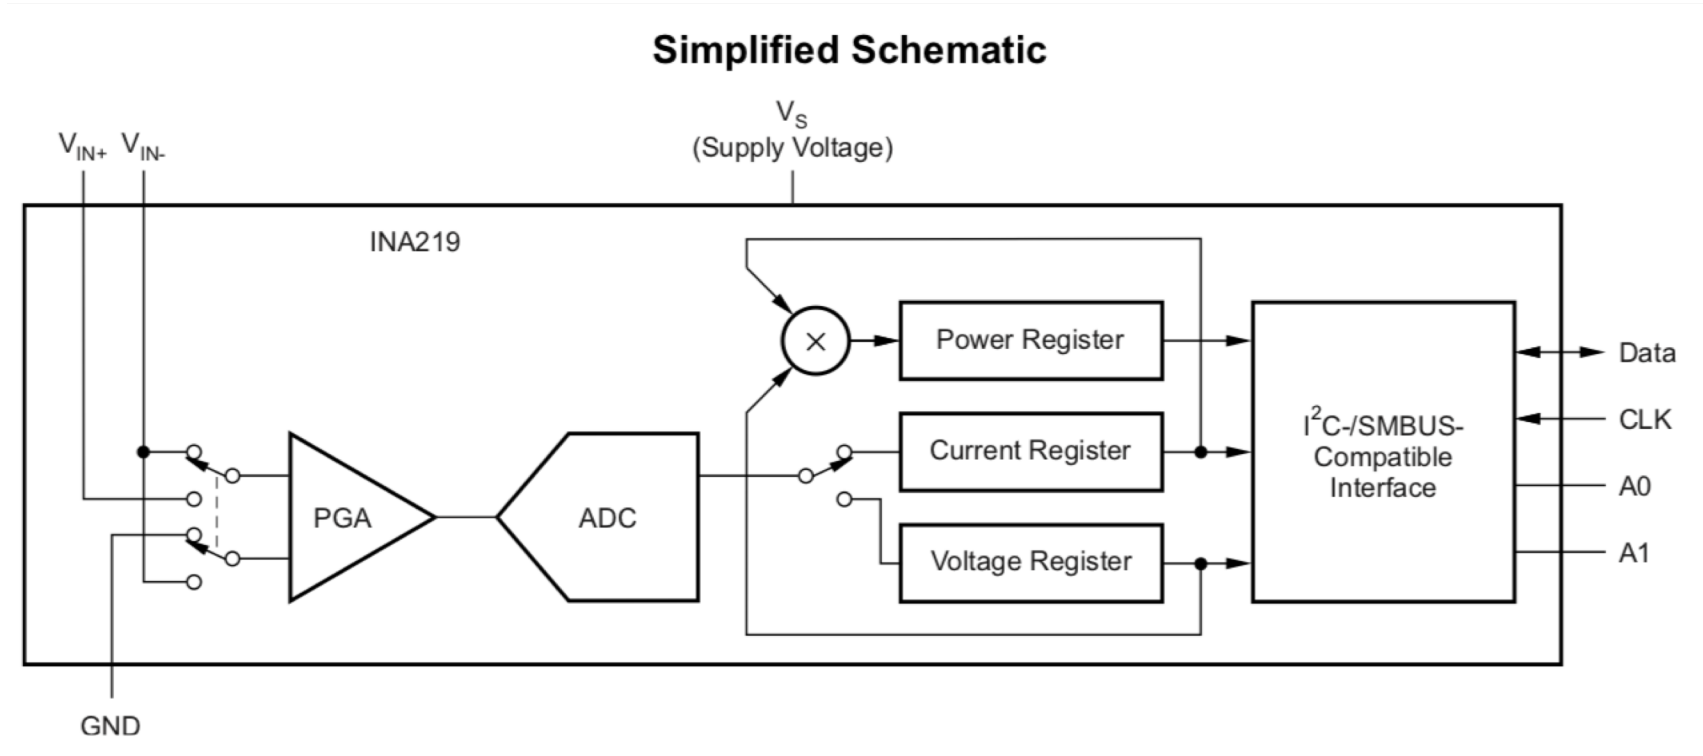

The INA219 senses across shunts on buses that can vary from 0 to 26 V. The device uses a single 3- to 5.5-V supply, drawing a maximum of 1 mA of supply current. The INA219 operates from –40°C to 125°C.

#### Device Information<sup>(1)</sup>

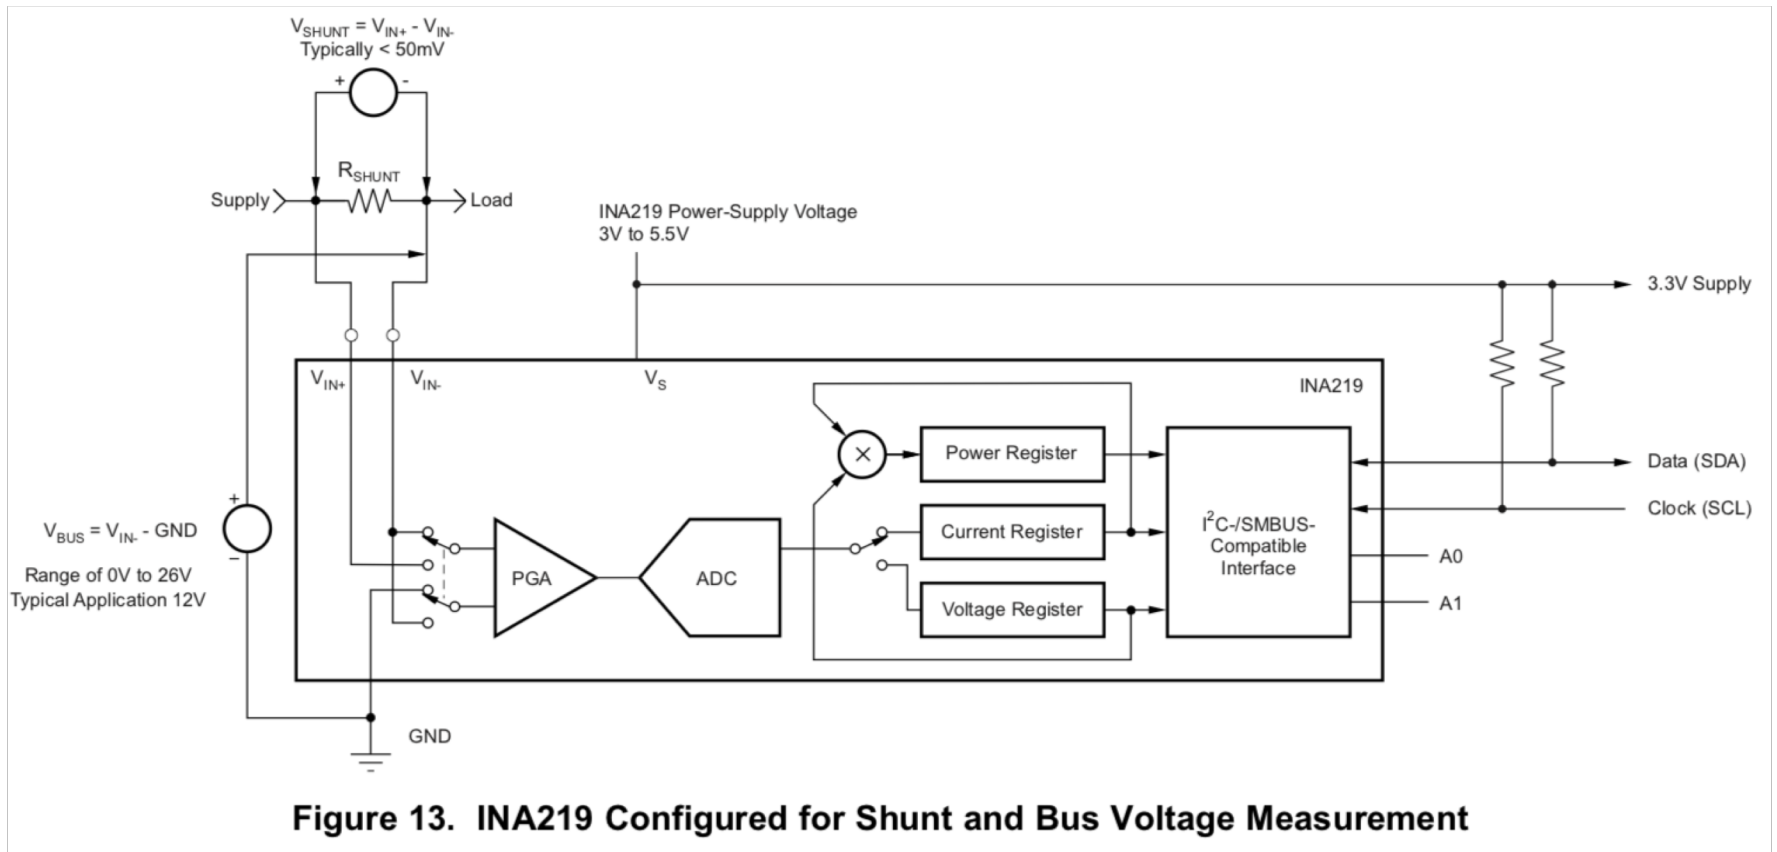

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA219	SOIC (8)	3.91 mm × 4.90 mm
	SOT-23 (8)	1.63 mm × 2.90 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4. Complement the binary result : 000 0010 1111 1111
5. Add 1 to the Complement to create the Two's Complement formatted result → 000 0011 0000 0000
6. Extend the sign and create the 16-bit word: 1000 0011 0000 0000 = 8300h (Remember to extend the sign to all sign-bits, as necessary based on the PGA setting.)

At PGA = /8, full-scale range = ±320 mV (decimal = 32000). For  $V_{SHUNT} = +320$  mV, Value = 7D00h; For  $V_{SHUNT} = -320$  mV, Value = 8300h; and LSB = 10µV.

**Figure 20. Shunt Voltage Register at PGA = /8**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIGN	SD14 <sub>8</sub>	SD13 <sub>8</sub>	SD12 <sub>8</sub>	SD11 <sub>8</sub>	SD10 <sub>8</sub>	SD9 <sub>8</sub>	SD8 <sub>8</sub>	SD7 <sub>8</sub>	SD6 <sub>8</sub>	SD5 <sub>8</sub>	SD4 <sub>8</sub>	SD3 <sub>8</sub>	SD2 <sub>8</sub>	SD1 <sub>8</sub>	SD0 <sub>8</sub>

At PGA = /4, full-scale range = ±160 mV (decimal = 16000). For  $V_{SHUNT} = +160$  mV, Value = 3E80h; For  $V_{SHUNT} = -160$  mV, Value = C180h; and LSB = 10µV.

**Figure 21. Shunt Voltage Register at PGA = /4**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SIGN	SIGN	SD13 <sub>4</sub>	SD12 <sub>4</sub>	SD11 <sub>4</sub>	SD10 <sub>4</sub>	SD9 <sub>4</sub>	SD8 <sub>4</sub>	SD7 <sub>4</sub>	SD6 <sub>4</sub>	SD5 <sub>4</sub>	SD4 <sub>4</sub>	SD3 <sub>4</sub>	SD2 <sub>4</sub>	SD1 <sub>4</sub>	SD0 <sub>4</sub>

At PGA = /2, full-scale range = ±80 mV (decimal = 8000). For  $V_{SHUNT} = +80$  mV, Value = 1F40h; For  $V_{SHUNT} = -80$  mV; Value = E0C0h; and LSB = 10µV.

**Micropython library for the TI INA219 voltage/current sensor ...**  
<https://forum.micropython.org> > ... > [Drivers for External Components](#) ▾  
May 16, 2017 - [https://github.com/chrisb2/pyb\\_ina219](https://github.com/chrisb2/pyb_ina219). I have written this library based on one I wrote for the Raspberry Pi. It supports the **INA219** voltage, current and power monitor sensor from Texas Instruments. The intent of the library is to make it easy to use the quite complex functionality of this sensor. Its currently ...

# INA219 Driver Usage Instructions

## Usage

If you want to give it a try then copy [ina219.py](#) onto the flash drive of your pyboard, connect the sensor to the I2C(1) or I2C(2) interfaces on the pyboard, then from a REPL prompt execute:

```
from ina219 import INA219
from machine import I2C

I2C_INTERFACE_NO = 2
SHUNT_OHMS = 0.1

ina = INA219(SHUNT_OHMS, I2C(I2C_INTERFACE_NO))
ina.configure()
print("Bus Voltage: %.3f V" % ina.voltage())
print("Current: %.3f mA" % ina.current())
print("Power: %.3f mW" % ina.power())
```

← Depends on MicroPython port  
See next page

[https://github.com/chrisb2/pyb\\_ina219](https://github.com/chrisb2/pyb_ina219)

# INA219 Example

```
from ina219 import INA219
from machine import I2C, Pin
from board import SDA, SCL
import time

i2c = I2C(id=0, scl=Pin(SCL), sda=Pin(SDA), freq=100000)

# optional: detect all devices connected to I2C bus
print("scanning I2C bus ...")
print("I2C:", i2c.scan())

# initialize INA219
SHUNT_RESISTOR_OHMS = 0.1
ina = INA219(SHUNT_RESISTOR_OHMS, i2c)
ina.configure()

# read measurements
while True:
    v = ina.voltage()
    i = ina.current()
    p = ina.power()
    print("V = {:.2f}, I = {:.2f}, P = {:.2f}".format(v, i, p))
    time.sleep(0.5)
```

# How can we plot the result?

---

- Connect plotter to ESP32?
  - And run Matlab or Excel?
- Better solution
  - Do the plotting on a computer that's made for this (e.g. laptop)
  - How do we get the data there?
